

SUCCESS STORY

## A private equity firm expands efficiency with cloud-based integration platform from GFT

The cloud-based application helps a private equity firm tie together new and existing IT systems and enables business partnerships

Time-to-market acceleration

Real-time data processing with cloud-based integration platform

CLOUD

DATA ENGINEERING

THE CHALLENGE

### Integrating new systems

- A large U.S. private equity firm sought to improve its ability to integrate data and information among a range of existing applications, new software solutions and partners' systems.
- It needed, for instance, to be able to quickly and securely integrate its systems with that of a new retail partner to handle onboarding and client servicing as the partner began to offer one of its funds.
- Previous point-to-point integrations were not standardized and not repeatable, and they created more network traffic than it should have.

THE ENGAGEMENT

### Cloud-based integration platform

- The platform provides a foundational toolset, standardizing a range of tasks and controls that used to be built from scratch for every integration, and providing a software development kit for engineers.
- The CIP protects the firm's data with improved reliability and increased resiliency.
- The platform build in automation for all new implementations, boosts the firm's capabilities for adopting new systems and expanding business opportunities.

THE BENEFIT

### Business enabler

- The CIP solution from GFT is now in use by the client for a range of direct and indirect integration tasks, cuts the time needed to go to market for business, improves existing integrations and improves the firm's operations.
- The platform is cloud-based, it's helping the firm push its systems toward real-time data processing, with the associated gains in functionality.
